This book shines in its amazing and impressive presentation of the human body. I strongly suggest to every medical student not to learn how to locate structures nor what they look like using cartoon drawings and artistic representations. Rohen's shines because you don't only see the real structures, you see their texture, colouring, and spatial relationships. The same part of the body is also commonly displayed from different views/slices, and every structure is dissected with exquisite dexterity, revealing structures through various layers.This edition of the series also has labeling of the structures with arrows and lines, with the name of the corresponding

structure away from the structures themselves, so it's like the book works as flash cards too! This book specifically shines in: -GI system-Head neck (you'll be thankful you got the book for just reason, haha)-Male/female pelvis-Being light on text. Use this book for the visual component of your studies, and supplement it with Netter's and Moore's. This book is great for the entire human body though, because you get to see every single tendon and ligament as well too. Everything you can imagine and need is in here! This is the most impressive and useful textbook I've had in medical school so far, and highly recommend it to any MS-1 starting out! My book has since degraded in shape since it's older and I've carried it around so much, but I'm definitely getting another copy to keep with me for the rest of my medical career. It's a must-have!

The many color photos of dissected tissue from different angles, supplemented by drawings, is a really super guidebook for working on the human form. I'm in the dissection lab this week and the book is a very helpful reference. The index is taking a little time to figure out; not the clearest organization for my preference.

The on-going core of this atlas is its standard of realistic illustrations that portray anatomical relationships. Photographs of actual cadaver dissections along with numerous schematic drawings aid the student in anatomic orientation. Chapters are organized by region, in order of a typical dissection. Each chapter contains two sections: a description and illustration of organs, and a depiction of those organs within the regional anatomy. New to this edition is an increase of MRI pictures, approximately 30 schematic drawings made even more precise, and an updated text where appropriate. A Brandon-Hill recommended title.

From Book News The new edition of this awesome, stunning atlas (2nd, 1988) is improved with new macrophotos, schematic drawings, and CT-scans and MR-images (providing a more detailed outline on cross-sectional anatomy, particularly of the extremities).
