Plant virology is a relatively young scientific discipline that has developed rapidly in the last decades. Consequently, there appeared an urgent need to prepare a dictionary that would include precise translations of equivalents in various languages. In the general part of this dictionary 2089 English entries are included. These entries, in addition to equivalents in the other four languages contain an interpretation of every entry in extent of 2-4 lines in the English and Russian languages. The special part of the dictionary contains in five languages 2522 common names of the viroid, virus, mycoplasmic and rickettsial diseases of higher plants (Bryophyta, Pteridophyta and Spermophyta). The order of diseases is given according to the contemporary scientific (Latin) names of the most important host plant.

This is definitely a tome for technical collections. Biological Sciences Language Notes Text: English, French, German, Russian, Spanish
