**Victor P. Eroschenko PhD : diFiore's Atlas of Histology with Functional Correlations (Point (Lippincott Williams Wilkins))** before purchasing it in order to gage whether or not it would be worth my time, and all praised diFiore's Atlas of Histology with Functional Correlations (Point (Lippincott Williams Wilkins)):

By ACThis would make a good text for an introductory course (perhaps a second year college course), but would not be considered anywhere near superior for any type of advanced course (e.g. 400-level college course, graduate study, medical school).The strengths of DiFore's Atlas are that it is a good blent between an atlas and a text. There are a good number of pictures as well as very concise text. The clinical correlations are a very good addition, but seems to be less and less a distinguishing factor as there has been a great shift to a clinical emphasis in the sciences.The majority of the images in this atlas are artistic renditions (i.e. drawing)

of histological sections. Therefore, you are getting the most ideal situations. But there's the rub. The main problem with this atlas is that it predominantly drawings and not real histological samples. It would have been much better if it were around 1:1 or 1:3 drawings to images. You do not get to train yourself to identify what is background "noise" and what are actual important landmarks and cells. I would not recommend buying this text unless you are trying to learn histology on your own outside of class. 1 of 1 people found the following review helpful. Great book By Sam I loved the book the moment I opened my package. I was impressed at the great illustration within the book. It is very helpful since I'm in med school and studying histology at the moment - a great reference guide to help you further understand histology. Simple and easy to use while being on the appropriate intellectual level. I would recommend this book highly!!! 0 of 0 people found the following review helpful. Great book By Marianne P H Offers great illustrations and real pictures and examples! This book is very informative too because I learned additional things through here which was not mentioned in my textbook or during class.

diFiore's Atlas of Histology with Functional Correlations, Eleventh Edition, explains basic histology concepts through full-color, schematic illustrations. These illustrations are supplemented by more than 450 digitized full-color online photomicrographs of histological images. Part One explains tissues and their relationship to their systems; Part Two addresses organs in a similar way. Targeting undergraduate, allied health and first and second year medical students, the Eleventh Edition includes new and enhanced images through redrawing and digitization to provide increased detail. This edition also features updated illustrations and information on the functions of cells, tissues, and organs of the body based on advances in research and expert recommendations. The atlas' student-friendly "Functional Correlations" sections help students study structure and function together. Students also benefit from a "realistic" perspective as more than 70 micrographs appear adjacent to color illustrations. A companion Website offers student and instructor versions of diFiore's Interactive Atlas with all of the images from the book.
